

Here's your text translated into English, keeping the same structure and emphasis:

Wow, this is a crucial question, bro! If you want to switch topics or datasets midway, the answer is **absolutely possible**, but there's a "time bomb" risk you need to calculate.

Since Assignment 2 is **Machine Learning Model Development**, your lecturer emphasizes the *end-to-end* process. Here are the consequences and steps you'll face if you change topics:

1. Technical Consequences (Risks You'll Face)

- **Disconnection from Assignment 1:** Your Assignment 1 was *Descriptive Text Analytics* on the *AI/ML Job Market 2026* dataset. If you completely change datasets (e.g., from job postings to housing prices or Twitter sentiment), you'll **lose the "project continuation" justification** you built in your report.
- **Loss of Preprocessing Results:** All the cleaning and vectorization (TF-IDF) code you built with your AI Agent in the previous notebook becomes useless. You'll have to start from scratch in **Preprocessing** and **Feature Engineering**.
- **Rubric Requirements:** The Assignment 2 rubric demands justification of model choice based on the **"nature of the dataset and problem domain."** If the dataset changes, you'll need to rewrite the *Related Works* section and theoretical justification from scratch to make it relevant.

2. Steps If You Still Want to Change Topics

If you're determined to use a new dataset, you need to move quickly to avoid late penalties:

1. **Check Compatibility:** Does your new dataset have a clear **target variable**? (For regression, it must be continuous numbers; for classification, it must have categorical labels.)
2. **Re-audit the New Dataset:** Ask your AI Agent to run quick *Exploratory Data Analysis* (EDA). Is the data clean? How many missing values are there?
3. **Adjust Model Justification:** Different data means different characteristics. For example, if your new dataset is *tabular* (not text), TF-IDF is no longer relevant—you'll need to switch to encoding techniques (like One-Hot Encoding).
4. **Update the Report:** You'll have to restructure your `stink3024_assignment2_report_draft.md` report from the ground up.

3. Strategic Advice

- **If you still have plenty of time (before Week 10):** Go ahead and switch if your current dataset feels "problematic" or uninteresting. It's better to change than to force a model on poor-quality data.
- **If time is tight (approaching Week 10): HIGHLY NOT RECOMMENDED.** Since you already got an **Excellent** score from the AI Agent's audit of your current dataset, it's better to focus on polishing your existing model's performance so your report becomes sharper and more authoritative.

Conclusion

If you change topics, you can still complete Assignment 2, but you **can't just jump straight in**. You'll need to step back to *Data Collection* and *Preprocessing* first.

So, what's your reason for wanting to switch topics? Do you feel your current dataset isn't challenging enough, or did you find a new dataset that's way more exciting? If the new dataset is truly "meaty," there might be a way to transition quickly without a total overhaul.

Would you like me to help you weigh whether your current dataset is strong enough, or explore how to adapt smoothly to a new dataset?
